

ABSTRACT

A system and method for displaying port performance of networking devices (6) is provided. The system is implemented in a networking infrastructure which includes an administrative workstation (2) and at least one networking devices. The administrative workstation can obtain and display information on ports of the networking device in real time. A plurality of port information pages (28) formed according to a simulating figure (280) of the networking device are provided by the administrative workstation. The simulating figure is for simulating a front panel of a respective network device and comprises a plurality of port icons (282). The port icon is for displaying traffic volume statuses for corresponding ports respectively with different colors and image configurations. A current event bar (286) is provided for displaying the most up-date event information of the networking device.
